CSC301 Meeting September 25

Summary

Action Items

- [ ] Industry partner to prepare and share a document with company overview, feature list, and competitor list via WhatsApp group by next week ▸
- [ ] Industry partner to provide an OpenAI API key when the team is ready to test workflows ▸
- [ ] Industry partner to check with co-founder on availability of Gemini ("Jeff") credits for the team ▸ ▸
- [ ] Saad to poll the team and email the industry partner to schedule a follow-up meeting (Wednesday or Thursday before 5 PM) ahead of the Tuesday demo ▸ ▸
- [ ] Team to build mockups for the first deliverable, due Friday, with demo to TA (Salman) on Tuesday ▸ ▸
- [ ] Team to do market research on existing competitor tracking / SWOT tools (suggested: use ChatGPT deep research) ▸
- [ ] Industry partner to add the final project showcase (tentatively December 7) to their calendar and attend in person ▸ ▸

Meeting Overview

- This is the initial kickoff between the CSC301 student project team (University of Toronto) and their industry partner, who runs an AI compliance company (SOC 2 / HIPAA compliance for companies using AI and agents) ▸
- The industry partner was previously a CSC301 student, reconnected with the course coordinator David, and became an industry partner to define this project ▸

Team Introductions

- **Ibrahim** — 3rd year CS specialist, St. George; experience with React, AI integrations, AI workflows ▸
- **Essam** — CS specialist, UTM; React, Node, JS, HTML/CSS, Python, Java ▸
- **Saad** — 4th year CS + Stats major; Python, Java, Node, HTML/CSS, React ▸
- **Sukhman** — 4th year CS + Stats; full stack, interested in AI/LLM integrations ▸
- **Jaynik** — 3rd year CS specialist, St. George; React/TypeScript (Ontario Treasury), Python ML ▸
- **Houssam** — CS, Full-stack development, applied AI, Unix/Linux experience
- **Yash** — 4th year CS specialist, UTM; AI integrations internship (Henley Contracting), Azure, webhooks ▸

Project: Live SWOT Competitor Analysis Tool

- The industry partner currently tracks competitors manually via a spreadsheet; the goal is to automate this with AI agents ▸ ▸
- **SWOT** = Strengths, Weaknesses, Opportunities, Threats — internal (S/W) vs. external (O/T) factors relative to the company ▸ ▸
- The SWOT must update dynamically as competitors make moves; it is used by the sales team to position the company and answer investor/customer questions ▸ ▸

Key Features & Requirements

- **Central overview page** showing an aggregated SWOT graph/table across all competitors ▸
- **Individual competitor pages** with a summary and drill-down details; clicking a data point reveals which competitor it relates to ▸ ▸
- **Add competitor flow**: user inputs company name + website; system queues it for automated research and adds it to the overview ▸ ▸
- **Automated research workflow** pulling from multiple sources: job postings, fundraising news, press releases, product updates, media ▸ ▸ ▸

- **Key metrics to track**: automation level of competitors, new features, hiring trends (role types signal strategic direction), press releases ▸ ▸
- **Refresh cadence**: runs once per week per company ▸
- **Scoring**: features/updates can be scored (e.g. out of 10) for graphing and comparison ▸
- **MVP scope**: start with manual competitor entry and basic research workflow; auto-discovery of competitors is a stretch goal ▸ ▸
- **Target users**: founders and the sales team ▸
- The tool should be **generic** (not compliance-specific) so it is broadly useful and résumé-worthy ▸

Tech Stack Preferences

- **Frontend**: Next.js on Vercel preferred (matches the company's current stack), but team has flexibility ▸
- **Backend**: Python preferred for the same reason ▸
- **Database**: Postgres required — company already has Postgres infrastructure and does not want to add another DB type ▸
- **AI/Agents**: OpenAI API (partner will supply an API key); team encouraged to cache prompts and use smaller models where possible to save costs ▸
- **Design workflow**: industry partner suggested Figma / Claude design → Claude Code for rapid prototyping; mentioned an AI-driven loop of code → push to GitHub → deploy → test → iterate ▸ ▸ ▸
- The project is **standalone** — no integration with the partner's existing internal systems is expected; documentation on architecture will be appreciated at the end ▸ ▸

Communication & Next Steps

- A **WhatsApp group** was created during the meeting for day-to-day communication; email also acceptable ▸ ▸
- Follow-up meeting to be scheduled for **Wednesday or Thursday before 5 PM** so the partner can review mockups before the deadline on Friday ▸ ▸

- The week after, the industry partner will be in **San Francisco** and has limited availability ▸
- **Final showcase tentatively December 7** — industry partner confirmed they will attend in person ▸ ▸

Notes

Transcript

That's working in the compliance space for, um, I don't know if you guys have heard of SOC 2 or HIPAA and stuff like that. We are doing this for companies with like AI and with agents basically. And That's basically in a nutshell what we do. I was a 301 student last year. So I've kind of done all of this before and I had a chance to like talk to David again a while back and he was like, yeah, we, we're looking for project partners and then that's how we define this project and we started to And now I'm an industry partner, technically speaking.

Um... Yeah, that's basically how I got introduced. And the idea here was that we wanted to have a way to be able to keep track and... see and understand what's happening in the market. compliance. There's a lot of competitors in the market. There's a lot of people who are doing different things and keeping track of it is difficult. That's why I wanted to automate it with AI and with agents. And that's how this idea of having a like a live SWOT analysis came up where we can see what others are doing, and then we can from that understand and plan how we're going to go with it, if that makes sense.

Yeah, have you guys ever... seen what a SWOT analysis is and how it looks like?

I haven't personally, no.

No, okay, okay. Anyone, have you guys taken any business courses? Ah.

Yeah, not really, yeah.

No, I haven't taken any business courses. Me neither.

Okay. Okay. That's fine. Here, okay, let me share my screen. Host isn't allowing sharing screens for this meeting. Okay, someone has to give me access.

Ahem. Give me one second. I'm not sure why it's doing that.

Yeah, take your time.

Yeah, I still don't have access, okay. Until you set that up, just wondering, tell me about you guys a little bit more. I want to know what you guys are doing and what made you guys interested in this in general. Um,I can go first. My name's Ibrahim. I'm a third year computer science specialist at the St. George campus. I personally have experience with React development, AI integrations and working on AI workflows.

And I mean, I chose this course just for a bit more experience and being able to actually work with like a real partner while also doing the course. Okay, okay, pretty cool, pretty cool.

I'll go next. My name is Ismail Mansi. I'm a computer science specialist at the UTM campus at the Mississauga campus. And I also have experience working with React, Node, JavaScript, HTML, CSS. Aside from the basic language like Python and Java. And for the same reason as Hussein, I also took this course so that I can improve my experience.

I can go next.

Okay, pretty cool. All right. Correct.

I guess I'll go Alright, okay.

No, it's fine. I'll go after this.

So a little bit about me is my name is Saad and I am in my fourth year of CS major and stats major. I've worked a lot with Python, Java, Node, HTML, CSS, and some React as well. And I'm taking this course for the same reason. Basically, I want to get some good experience. I want to learn and just build something that really can have a good, viable impact. and make a difference.

Okay.

Yeah, pretty cool.

Pretty cool.

I'm a 3D RCS specialist at the St. George campus. I've experienced with a bunch of, I guess, languages, TypeScript, JavaScript, React with React. SQL, Java, and I have some experiences with hackathons and I wanted to take this course to have more experience with industry professionals and to learn more about that. I can go next.

Yeah, so my name is Sukhman. I'm a fourth year computer science and stats double major. And I'm interested in full stack development. I've worked on so many projects with so many different frameworks, but I'm super interested in AI integrating into like the actual product and the LM API keys are in chief. So I haven't gotten like a lot of experience with that. So I'm hoping I can get some experience with that in this project. Okay, pretty cool.

My name is Jay Nick. I'm a third year CS specialist at the St. George campus. And last summer I worked as a software dev for the Ontario Treasury Department working on full stack solutions with React and TypeScript. And I also have experience with Python as an ML engineer for our school team and a web developer as well. And I took this project to also get some experience working with a partner and having that sort of developer stakeholder interaction to get understanding and familiarity with that.

Okay, okay, pretty cool, pretty cool.

My name is Yash.

I am a fourth year CS student at the University of Toronto, Mississauga, CS specialist.

And I have some previous, sorry if you can hear a lot of noise in the background, I'm actually on campus. No, you're fine, you're fine. Okay, good. So I previously did a internship at Henley Contracting. So I was working with AI integrations and I got to learn more about cloud and like how to integrate it into the workflows of how companies work. But the process, I also learned a little bit of Azure and a little bit of how webhooks work. So overall, again, like a fairly solid foundational experience in AI integrations. And that's why I wanted to kind of pursue more.

And that's why I took 301 so I can possibly get a chance to work with AI integrated into AI integration related projects.

OK, OK, pretty cool, pretty cool. OK, OK. OK. Can you guys walk me through, like, what was the, did you guys have to submit a proposal for when you guys signed up for a project or was it like just literally you just apply for one and then you get in and they assign you to whatever idea you want to get into? Okay.

So we had like a few different choices.

So we made four choices and then based on that they matched us. Based on like our skill sets, you know, we get the descriptions what we've done, why we'd be

good fits and stuff like that.

I said. Okay. Pretty cool. Okay. So let's start with this then. Let me walk you guys a little bit through what a SWOT analysis is. Again, like this is like SWOT analysis is really big in like business. I was trying to pick an idea where it was something that we were going to use every day and something that was actually a real-time, real-life workflow that's applicable so that you guys can get some real-time experience as well.

Again, my goal isn't to like, I don't want to... If you say like babysit you guys to like make sure you guys do it. The idea was I wanted to make this project that's broad enough where you guys can literally do whatever you want so that you can figure out and focus on the things you actually enjoy working on. Um, So yeah, that's basically my goal here was to give an opportunity for you guys to see and work with you guys to see and help you guys grow and in return you guys get the experience and i will we will use your this product every day in our in our company basically right Um, Yeah, so basically a SWOT analysis, there's four parts to it, right? S, W, O, and T, which makes it the SWOT.

And it's the strengths, weaknesses, opportunities, and threats within SWOT. a business, if you may say. And the idea here is that depending on what other people are doing. your SWOT analysis has to change. Constantly. Right. Uh, let's say, I don't know, like, let's say our, our strength as a company here is that we're both, let's say we're technical founders. Um, I I don't know, we've done this before. We have founder market fit in this space.

And then our weakness is we don't have, I don't know, a big enough brand, let's say, right? I mean, there's more details to this, but this is just like an overview so you understand the domain. Um... And then you look at the opportunities and the threats, right? What is it that we are able to do that our competitors cannot do? which will be the opportunities we have in the company. It could be a feature. It could be a pricing structure. It could be whatever it is.

And then we have threats, which is what will be a threat if, I don't know, a company launches a new product line or something. they add a feature that's close to what we were working on. So, you know, that's going to be a threat towards the company, right? And when you put this in a table, The whole idea is when you look at a SWOT analysis, you understand where you are at compared to the... market.

If that makes sense. Any questions about this so far? So I guess I was just wondering, so is the main idea behind this whole project that for you as a company, being able to get SWOT analysis for like a number of your competitors and just being able to like visualize that and have a workflow run over a period of time, just getting that all of that information back to you all in one place? Yes. So there's going to be a page where I see the SWOT analysis and then I can have a page my competitors, let's say, where I put in the name of that company and then let's say their website or whatever other information you guys want from me.

which will then have this like workflow where you guys go look at these companies from different sources it could be i don't know hiring maybe it could be fundraising it could be media whatever you guys want to add and then condense that into some information where it will be able to be displayed in a graph where I can then see and visualize and then The sales team will use this so that we can help our customers figure out best what solution is better for them.

and to price ourselves in the market properly and a lot of other factors, right? Um, That's the goal, or that was what I envisioned.

Okay, so just amazing. So essentially like sort of like a data scraper, but then doesn't just get the data, analyzes it, creates a graph, bar chart, whatever you want, and just brings it all together. Yes.

Does that make sense? Anyone else, any questions?

And would you say your main customer base are more businesses rather than just like single end users?

Yes, we sell to businesses, a lot of startups and I would say like SMBs right now. Yes. So compliance work we do is requirements for these companies to be able to sell to enterprise. and sell to bigger businesses. And so typically companies after they fundraise, after they've had some traction for the product, they start looking at getting our services. uh, And yeah, that's basically the whole pitch here is that if they had to do it themselves, they would be spending hundreds of hours spending, you know, their own time working on these technologies and we can do it for them with agents. and like with AI.

Makes sense. Yes. One question I had is like, would you say like the SWOT analysis will need some of the documents that are used within your company, like

certain, I guess, like rules and guidelines or like policies that you have integrated? Like would the SWOT kind of need those for its own information?

Um, If you were to compare them to our company, yes. I would say. That would be too complicated, I feel like. Let's start with just having the competitors, and I can give you guys a list actually right now even. I have a little spreadsheet where I keep them, but... We start with that list. see what's happening and what's going on and then When you guys get to a point that's like good because I think the first step for you guys is to make an MVP So let's start something simple, something basic that will just work with basic companies and then Once we are done, Done with that, then we can sit down and say, OK, now what can we add to this to make it more interesting, both for you guys and more useful for us.

If that makes sense.

And I was also wondering, with your competitors, are there any specific KPIs, metrics, anything in specific that you're looking for when looking at competitors? Um...

I would say the biggest ones for us is Like how much of the work of let's say compliance they're automating. and keeping track of like new features they add and and. how many people they're hiring and stuff like that is also important. just because it will give us like a little idea of, okay, what direction are they going to, right? Like you can look at, the roles and the job descriptions. And be like, okay, like these guys are hiring more product people or they're hiring more engineers.

or I don't know, whatever. And these all... could be used to basically understand what they're doing. Other thing would be press releases, right? Like if... They have a new feature they added. They're going to be like, hey, this week we added X, Y, Z, and this is going to revolutionize the future of whatever, right? And having these information and being able to condense it down to features. or like scoring them, let's say out of 10, compared to each other or whatever, however you guys want to build the system.

would then allow us to graph it, right?

Um,Yeah, I think that makes sense. And then I guess one more clarification, I think you mentioned the, so with the SWOT analysis, like would the idea be that for each competitor they have their sort of They have their own SWOT, I guess, table or chart. Um...

That will work. That could be an idea. I mean, it totally depends on how you guys want to design it. If. if it was all in one, it would be nicer where it's like competitors are doing X, Y, and Z. And then if I click on that thing, I can see which competitor is doing that. But also having a page or like an overview per each competitor will also be nice. Just because if I'm like, oh, how am I different from competitor X, then I can see a little overview information or like just to summarize the summarization of what they're doing, right?

So what happens is a central page and then you can dive deep into any of the specific competitors.

Yeah, yeah. So imagine an overview, which is the actual swap graph, and then there's a competitors page where... If I click on whoever, I can see the summary. And then if I click add, I can add a competitor and it will be added there and it will get queued up for like, the research that you guys are doing for the workflow and update it. And then this will run, let's say every week, once a week for each company.

we're going to have to do that. which would then... updates Whatever's happening.

OK. No, that makes sense. Thank you.

Yeah, yeah, no worries.

Any other questions, guys?

It should work now, yeah.

I'm sorry, I believe you also wanted to show us the slot, like screen share something.

Oh yeah, yeah, yeah. I mean, I didn't have access to share my screen. Is it working now? Okay, sick. Here, I mean, this is like, I literally pulled this off of a Google search, but like... basically, um, You have something like this, right? That's the idea. And you can fill it out with like, actually, this is a better picture of what... Like the state of the game basically, right?

Whereas like strengths are like, okay, like, you know, what do we do well? What are we doing that's better? All these different things. I can give you guys a little bit of information about this if you want or make a document that will give you some points. But again, these are all relative, right? So this will have to update

depending on what the competitors are doing. Opportunities, right? uh, I don't know if...

Actually, let's go to Wikidata first. Wikidata is better. What are the other people doing that's different? What are other people doing that's... If they add a new feature or if they're automating something or doing something in a certain way or even positioning themselves differently, that would go on the top tier. Right? Oh, come on. Um... Yeah, and so basically strength and weaknesses are internal.

These are all relative to us as a company. So you would need like a little page as well for me to like give you guys some details of the service offerings we have and what we're doing and features let's say. Then external will be opportunities. what opportunities are available in the market, right? the company goes bankrupt or I don't know, There was a company a while back that they were... faking evidence, which made them become, like, get in trouble and made a bunch of companies have problems with their compliance, that's an opportunity, right? Because it's like, oh, this company is going bad.

There's an opportunity to, I don't know, steal our customers, let's say, for example, right? So that would be an opportunity or a threat would be competitor X added a new feature that is basically what we're doing or something like that, right? which will then be like an external negative threat, right? If that makes sense.

I think that makes sense. And do you have any specific UI preferences, any styles, any assets, anything like that that you wanted to use? Or is it sort of up to us?

No, it's totally up to you guys. I would say take a mix of-what you guys like and what you want to learn, right? And if you think, I don't know, using something like Tailwind or whatever it is helps, use that. uh, The only thing is that we're hosting our stuff on Next, so like on Vercel. So ideally, if you guys use Next, that would be really nice for frontend. Um, and back in the Python, but that's, that's, That's purely because it's the same stack as what we're using right now.

That's why it's easier for me to help and offer guidance. But if you think you want to do it in a different language, different structure, different thing, and you guys want to know and you guys want to try it out and learn i'm totally okay with that too I'm trying to make it as open-ended as possible so that you guys would... It will challenge you guys if that makes sense.

I just, I sent a link like showing essentially a template of what we're supposed to demo next week. If you want to take a look at that. And also I wanted to ask like, Do you have any preferred mode of communications? Or do you want to keep communicating through email? Do you have any clarifications?

I mean, email is fine. If you guys want to use anything else, like, I don't know, like a... WhatsApp or something, I'm also okay with that. Um, Your product team name details. Um, Okay, what would you guys like from me to help you with this planning the document? I mean, I assume it's something that you guys have to fill out, right? So like how much information do you guys understand? How much, what is left?

What is it you guys want to... ask and we can go through it.

I mean, for now, like... I guess since you're giving us a lot of freedom. I guess we can, make the plan we'll uh And before Demo and get to the TA, we can maybe show you what we have so far.

Okay.

Yeah, yeah, that'll work. That'll work. Do you want to schedule another meeting for next week or something before the submission? What is your... Yeah, okay. Okay, I mean, I assume you guys still, like the classes are on Tuesday and Thursdays, right?

Yeah, I think we should do that, yeah. It's due on Friday. Yeah, we could do something before that if that works for you.

Yes.

Yeah. Where in Tuesday? The demo and stuff, yeah.

Yeah. Okay. Which one, which session are you guys in? Tuesday. Okay, so that's when you're going to be showing the... The TA. to get some feedback for the submission.

Yeah.

Um, If you want to, We can do something maybe Tuesday morning. Or maybe like Tuesday, Classes six to nine, so like around five-ish, you have some time to see build it and then I can give you guys some feedback so that we can prepare for the TA. Who's your TA, by the way? Who's the...

Yeah, his name's Salman, yeah.

It was in the original email. I forgot his name.

I think Salman.

Okay. Okay. Okay. Pretty cool. Pretty cool. Yeah, I'm okay with that too.

Totally. Open. Again, like here, if you want to, we can go through the main big four questions that are there is five questions. It's just what's the product? I kind of told you guys we walked through it. Is there any questions about that right now?

I think we're good for the most part. I think just to my understanding, it's like AI compliance, essentially. Completing...

Product means what you guys are building for me, right? So the live SWAT thing. basically, right? Who are the target users? Target users, founders and the sales team is what's gonna be using this. Uh... Thank you. What would you have a user choose your product? I guess this is a question you guys have to like do a little bit of market research on. to see what is available and, and, To my understanding, it's all manual right now. But they might be open source tools that are doing something similar.

So maybe do a little research or do a deep research with ChaiGPT or something to like give. And then you can use that for the answer. That's pretty straightforward. We AI'd all of this back in like last year. So just saying. I mean, Yuto Stories are basically... The idea will be, you guys have done user stories before, right? I think you guys did it for 207. Yeah, just all the features, list them down and be like, I want to check a competitor. I want to add a competitor.

I want to, I don't know, check our status overall.

Yeah, do it.

I want to update the features we have. These are... stories, I guess. If you want me to go through them, we can do something Tuesday morning and we can add them. Have you decided on how You'll build it. if there's anything you guys need me to like help you with regarding like architecture stuff i can also do that uh i've been doing a lot of these stuff for my company right now so i um And then IP and confidentiality, I'm totally okay with you guys doing whatever you want with this.

If you want to talk about it, uh, that is totally fine. Uhm? I think also in the application I said I will cover up to like I think costs. So we can also whenever you

guys have something ready to want to test it with like API tokens, I can make you guys an API key for our OpenAI. So you can use that too? Um...

Teamwork details. That's I guess that's you guys. That's not me. Sorry.

Not part of this document. It's part of our deliverable. So we just need to make a mock up for the demo. I know you mentioned that that's also up to us.

Is there anything that you...

Any sort of like anything that you have currently that...

like, Anything that you could copy or just make it similar to, or is that up to us as well?

I mean, I can show you guys, like, we have a...

Here, let me just show you this. This is, again, this is...

What's it called?

I've started using this yet, but basically, This is...

Here, let me just show you this. This is where I've been.

Share screen. Can you see my screen again?

Yeah, we can see it.

Yeah, we can see it.

Yeah, so basically, we have a little task manager we made. We have our own version of Notion, basically, where we have all the different stuff that we're doing.

There are deals we have in the pipeline, marketing content, all the customers or whatever.

we're trying to build this where we can track their compliance posture.

That's a big part of it. And then we also have like all the companies that we've like, you know, like work with or like I've talked to and are like, you know, actively engaging with.

Part of it is the competitor list that we have right now.

which is like whoever I find who is like interesting or like slightly interesting, we're adding it right now. It's purely just a list right now. It doesn't do anything else.

Right, so this is like the current design. For a mock-up, I mean, I don't really-Figma thing or for the Figma-template or whatever together.

We, for our current mock-up stuff, we do like cloud design.

Oh.

Once it's ready, we export it and give it the cloud code.

which would then be able to write these for us, right?

So maybe something similar would be also-Yeah, I think that's probably the best workflow.

Because if you are making something on Figma, you're going to have to-with Cloud Design, you can directly feed it into Cloud Code.

Yeah, yeah. And I mean, what we would do is basically we would have, like this is again, I don't know how much, David is pretty pro-AI, so I'm not going to I'll be pretty open about it. Basically, we would have Cloud to do the work, and then Cloud would push to GitHub, which would then be the platform we wanted to have. That was like an auto deployment.

And then if you use something like DigitalOcean or like Google, they have like tools where then the agent can read and verify the deployment.

the AI the feedback which would then like write code, push it, deploy it, test it, and then see what happened and then iterate from there, right?

And I mean, working with AI and everything is building that infrastructure which will allow you to iterate fast and build quickly, right?

So, um, You know, I mean, that's like a loop engineer.

as what we do right now, right?

Um, Yeah, that's basically it.

what I was thinking.

Wanted to clarify something?

Bye.

Go ahead.

So basically for the first deliverable, what they really want to do is plan things out, you know, ask questions which already answered and We basically have to make

a few concepts, like some mock-ups and stuff.

Yes.

Hmm.

Yes.

So what I was thinking was maybe we could do the demo on Tuesday. Maybe we could do it once a week.

Time before the deadline maybe that'd be a little bit better and then we could clarify anything else and ask you if that works.

That's sort of fine with me.

As long as you guys can tell me in advance.

I will say the week after I'm going to be in San Francisco. So it's going to be a bit harder for me to meet.

Okay.

But until Wait, actually, let me look at my calendar.

Um...

Yeah, until Friday or even Saturday, it will be fine.

If you guys wanted me to time I have a couple of meetings in that week but it's pretty open so yeah You guys have a good time.

Okay, I think we could maybe meet, yeah?

Sorry, yeah.

Oh yeah, go ahead.

Sorry, go ahead.

Yeah, yeah, yeah, that's totally fine.

I think maybe like Wednesday or Thursday, I'll just ask everybody to find a time and then I'll email you. Is that okay?

Yes. Wednesday is free right now. And then Thursday, anything before 5 p.m. would be...

Okay.

ideal.

Yeah.

And then, sorry, can we also grab your number? Yeah, yeah, yeah, here. You can add me to the chat.

Um...

Are you guys-I have a question. I have a question.

So like in the past, was there ever like a competitor who made like a change or a move that you completely missed?

That's a good question.

We've been getting a lot of questions when we talk to people.

about these guys. Have you heard of those guys?

How are you different than X, Y, Z? And we...

We are answering them, we're trying our best to answer them.

So we had to add them or do manual research so that we could answer it, right?

The idea here is that when we have this, then I can look at it, understand what's happening or what happened last week from my competitors. And then we can now...

answer these questions easier or even sometimes if it's like investor meetings or something i just pull this up and show them be like hey what's happening right now in the market and uh and then see what And answer your question this way, basically, right?

Yeah, that makes sense. Thank you. Yeah, yeah, no worries. That was a good question, though.

And in the end, you also want to have it a feature where it will be able to auto discover or now you just want it so you'd have to manually enter competitors. I think that would be. I mean, let's start with manual. Let's finish the deep research workflow thingy where there's more time.

Having it auto discover is also a pretty cool feature, so I'm not going to say no.

Um, But yeah.

One last question. It's totally fine if it's not possible, but is there any team, like, bot or codex plans that you guys provide? Or is it... We don't have a company codex. Everyone uses their own.

No worries. Yeah, for the workflows though and production, I will be able to provide you guys an API key for-Okay, sounds good. Yeah, that I can do.

So yeah, make sure you guys use it wisely as well, right? So when you're writing workflows, cache the prompts or learn how you can build agents with OpenAI. Right. Just so you can save money. And again, you don't need to...

What's it called?

every step of this process can be done by like a basic or like smaller agent right Or if you want to also maybe like use another frontier model like Jev, you can also use that too, right? Jev came out.

where you can do a hybrid of both. Jeff gives $5 of monthly credits. If you guys want to go and claim that, that would be pretty cool too.

Um, You guys know what Jeff is.

Jeff from type safe Yeah.

Yeah, I think we can definitely look into it. And then I think it's also safe to assume that work on it on our own, it's not really connected to any of your current systems. Yes, yes. I'm not expecting us to integrate into our system.

It will basically be like you.

We will be able to do it ourselves or like club will be able to do it. So like having a little, um, documentation at the end where it says like what is where and how things work Use Postgres for our database so that we can Because we already have Postgres infrastructure, we don't want to add any different type of database in the system.

So that would be also like the only sense.

Yeah. Again, again, it's like... Like the idea, and this is like why we started our company was AI agents are good enough.

It's just a matter of what you do and what data you give these agents. So it's like, what type of hardness you can make that will help you in a way, right? And that's what I expect from you guys is like, we're basically making a hardness.

Um, which will allow data from different sources to flow to track our competitors and what they're doing.

And I would say that's like basically the frontier of everything, right?

I was in like startup school for like YC two, three months ago. And that was all they were talking about is like, hardness is our future, hardness is our future, hardness is our future.

so Use harnesses.

I made a WhatsApp group if you want to check, double check. My phone?

Yeah, I got it. I got it. Do you guys know when the project showcases?

I've got to like book that off my calendar as well.

the project showcase for the final showcase.

Oh, well, let me check. All right, so I'll have to come in person for that. So I'm going to also add that to my calendar.

I believe our final demo is on the summary.

Yeah, I believe that's also the meaning for you coming as a partner as well, right?

Yes. Okay. Okay. I mean, like, like there was a presentation you guys want to like present.

where it's like basically they would put like tables and like Bay hand and then people would just come by and then see what's happening and And, uh, Yeah, I do.

If it changes, we'll let you know.

Yeah.

I mean, if it changes, we'll let you know, obviously, as well.

I think on the syllabus, I'm pretty sure it's December 7th. It's the only date that is for the final demo. Okay. That was the only time I saw David versus Tom? Yeah.

Okay. Okay. Okay. Yeah. I mean, I just got out of the WhatsApp so we can, um, update me in There are two. Yeah.

All right, any other questions, comments, concerns?

Let me talk to my co-founder. I might also be able to give you guys Jeff credits if that is. It's a pretty new thing. So it's like, you know, It's a completely new concept. It's like...

In my opinion, it's the next version of like what LLMs were trying to do.

But get back to me if you need any credits for that. I will see if I can get some.

I think that sounds good. I think before we leave, I think you mentioned if you could just send us the list of the competitors. Just copy it in the chat. And then I guess any other information that you feel would help us work.

OK, I can-I mean, this would probably not be necessary but give me till next week which is the-I can send here. Okay, I'll put this in the WhatsApp group chat.

Give me till next week when you guys want to like, I will prepare you guys a little document where it will explain what we're doing and then have a little feature list. So it's like a good starting point for you guys.

Would that work? That'd be amazing.

Yeah, that'd be great, yeah.

Sure, I will do that.

Uh, I think Yash also left a comment. I don't think he can speak right now, but he was just asking if he...

Yes. I mean, AI compliance is my business.

Right?

We are offering this to other companies.

for us to be able to basically track our competitors.

That's purely what it is. So it's like...

Yes, in theory, the feature list I'm going to give you guys about what we're doing, but In theory, that should work with any type of software.

And I mean, you guys wanted to be working with any type of idea and any type of company because You know, it's like you're putting on your resume and you want to, so, you know, don't be worried about, like, Compliance, just make it generic.

Okay, makes sense. Thank you very much. Yeah, yeah, no worries.

Um, Anything else?

I think that's it for now. I mean, we can ask any questions on the WhatsApp if we think of anything else. Yeah, yeah, yeah. I'll try to be as active as I can. And yeah, good luck guys.

Thank you.

Thank you.

Thank you very much.

Thank you. Have a good weekend. You as well. Take care. Bye.
